

# SafeVarargs Annotation Enhancements

**This SafeVarargs Annotation was introduced in Java 7.**
**Prior to Java 9,we can use this annotation for final methods, static methods and constructors.**
**But from Java 9 onwards we can use for private methods also.**

**To understand the importance of this annotation, first we should aware var-arg methods and heap pollution problem.**

## What is var-arg method?

**Until 1.4 version, we can't declared a method with variable number of arguments. If there is a change in no of arguments compulsory we have to define a new method. This approach increases length of the code and reduces readability.**

**But from 1.5 version onwards, we can declare a method with variable number of arguments, such type of methods are called var-arg methods.**

```
1)  public class Test
2)  {
3)     public static void m1(int... x)
4)     {
5)        System.out.println("var-arg method");
6)     }
7)     public static void main(String[] args)
8)     {
9)        m1();
10)       m1(10);
11)       m1(10,20,30);
12)    }
13) }
```

**Output**
**var-arg method**
**var-arg method**
**var-arg method**

**Internally var-arg parameter will be converted into array.**

```
1)  public class Test
2)  {
3)     public static void sum(int... x)
4)     {
5)        int total=0;
6)        for(int x1 : x)
7)        {
8)           total=total+x1;
```

```
9)        }
10)       System.out.println("The Sum:"+ total);
11)   }
12)   public static void main(String[] args)
13)   {
14)      sum();
15)      sum(10);
16)      sum(10,20,30);
17)   }
18) }
```

**Output**

**The Sum:0**
**The Sum:10**
**The Sum:60**

# Var-arg method with Generic Type:

**If we use var-arg methods with Generic Type then there may be a chance of Heap Pollution.**
**At runtime if one type variable trying to point to another type value, then there may be a chance of ClasssCastException. This problem is called Heap Pollution.**
**In our code, if there is any chance of heap pollution then compiler will generate warnings.**

```
1)  import java.util.*;
2)  public class Test
3)  {
4)     public static void main(String[] args)
5)     {
6)        List<String> l1= Arrays.asList("A","B");
7)        List<String> l2= Arrays.asList("C","D");
8)        m1(l1,l2);
9)     }
10)    public static void m1(List<String>... l)//argument will become List<String>[]
11)    {
12)       Object[] a = l;// we can assign List[] to Object[]
13)       a[0]=Arrays.asList(10,20);
14)       String name=(String)l[0].get(0);//String type pointing to Integer type
15)       System.out.println(name);
16)    }
17) }
```

**Compilation:**

**javac Test.java**
**Note: Test.java uses unchecked or unsafe operations.**
**Note: Recompile with -Xlint:unchecked for details.**

```
javac -Xlint:unchecked Test.java
warning: [unchecked] unchecked generic array creation for varargs parameter of type
List<String>[]
            m1(l1,l2);
              ^
warning: [unchecked] Possible heap pollution from parameterized vararg type List<String>
      public static void m1(List<String>... l)
                                  ^
2 warnings
```

**Execution:**

```
java Test
RE: java.lang.ClassCastException: java.base/java.lang.Integer cannot be cast to
java.base/java.lang.String
```

In the above program at runtime,String type variable name is trying to point to Integer type,which causes Heap Pollution and results ClassCastException.

```
String name = (String)l[0].get(0);
```

# Need of @SafeVarargs Annotation:

Very few Var-arg Methods causes Heap Pollution, not all the var-arg methods. If we know that our method won't cause Heap Pollution, then we can suppress compiler warnings with @SafeVarargs annotation.

```
1)  import java.util.*;
2)  public class Test
3)  {
4)     public static void main(String[] args)
5)     {
6)        List<String> l1= Arrays.asList("A","B");
7)        List<String> l2= Arrays.asList("C","D");
8)        m1(l1,l2);
9)     }
10)    @SafeVarargs
11)    public static void m1(List<String>... l)
12)    {
13)       for(List<String> l1: l)
14)       {
15)          System.out.println(l1);
16)       }
17)    }
18) }
```

**Output:**

**[A, B]**
**[C, D]**

**In the program, inside m1() method we are not performing any reassignments. Hence there is no chance of Heap Pollution Problem. Hence we can suppress Compiler generated warnings with @SafeVarargs annotation.**

**Note: At compile time observe the difference with and without SafeVarargs Annotation.**

# Java 9 Enhancements to @SafeVarargs Annotation:

**@SafeVarargs Annotation introduced in Java 7.**
**Unitl Java 8, this annotation is applicable only for static methods,final methods and constructors.**
**But from Java 9 onwards,we can also use for private instance methods also.**

```
1)  import java.util.*;
2)  public class Test
3)  {
4)      @SafeVarargs //valid
5)      public Test(List<String>... l)
6)      {
7)      }
8)      @SafeVarargs //valid
9)      public static void m1(List<String>... l)
10)     {
11)
12)     }
13)     @SafeVarargs //valid
14)     public final void m2(List<String>... l)
15)     {
16)
17)     }
18)     @SafeVarargs //valid in Java 9 but not in Java 8
19)     private void m3(List<String>... l)
20)     {
21)     }
22) }
```

```
javac -source 1.8 Test.java
error: Invalid SafeVarargs annotation. Instance method m3(List<String>...) is not final.
       private void m3(List<String>... l)
                    ^
javac -source 1.9 Test.java
We won't get any compile time error.
```

## FAQs:

**Q1. For which purpose we can use @SafeVarargs annotation?**
**Q2. What is Heap Pollution ?**
